Sequence 7, Application US/09226568
Pattent No. 6001992
GENERAL INFORMATION:
APPLICANT: Ackermann, Elizabeth J.
APPLICANT: Marcusson, Eric G.
APPLICANT: Bennett, C. Frank
APPLICANT: Dean, Nicholas M.
APPLICANT: Dean, Nicholas M.
APPLICANT: Marcusson, Eric G.
TITLE OF INVENTION: Antisense Modulation of No. 6001992el Anti-apoptotic
TITLE OF INVENTION: bcl-2-Related Proteins
FILE REFERENCE: ISPH-0337
CURRENT APPLICATION NUMBER: US/09/226,568
CURRENT APPLICATION NUMBER: US/09/226,568
CURRENT FILING DATE: 1999-01-07
NUMBER OF SEQ ID NOS: 39
SOFTWARE: Patentin Ver. 2.0

                    Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                        Score

                                               Producing sub-population of labeled nucleic acids, useful for analysing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers -
      Example 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            conditions to enzymatically generate sub-population of NAS, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAS which is useful for analysing the differences in the RNA profiles
                                                                                                                                                                                           WPI; 2002-314699/35.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              between several different physiological sources, where the method CC comprises producing subpopulation of labeled NAs for the different CC physiological sources, comprising the population, where the comparison CC source to identify differences in the population, where the comparison CC is preferably performed by hybridising the labeled NAs for each of the CC distinct physiological sources to an array of probe NAs stably CC associated with the surface of a substrate to produce a hybridisation CC pattern for each of the sources, and comparing the patterns for each of the sources, where differential gene expression assays are CC tissue e.g. neoplastic a normal tissue, or different tissue or subtissue types. The present sequence is a human gene specific PCR CC Note: The sequence data for this patent did not form part CC format directly from USPTO at the printed specification, but was obtained in electronic CC format directly from USPTO at the pattern contracts contracts the produce of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                 Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apoptosis and treating associated diseases e.g. cancer -

Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents a PCR probe for the human Al nucleotide
                                                                                                                                                                                                                                                                                                                                            Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                    Example 7; Fig 7; 2245pp; Japanese.

                    Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41123-4 amplify clone pm2245 which comprises the GS HUMGS001288 (T20288), located on chromosome 10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41123-4 amplify clone pm2245 which comprises the GS HUMGS001288 (T20288), located on chromosome 10.
                                                                                                                                                                                                                              Example 7; Fig 7;
                                                                                                                                                                                                                                                                        Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human

                                                                                                                                                                           Matches
                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                   The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide for the human Al nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apo

The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apoptosis and treating associated diseases e.g. cancer - \frac{1}{2}

```

mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. present sequence represents an antisense oligonucleotide for the establish the function of particular genes and as diagnostic agents sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to given in the present invention were designed to target human Al and present invention describes antisense oligonucleotides which modulate expression of novel anti-apoptotic bcl-2-related proteins. The A1 nucleotide sequence. in

Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apo and treating associated diseases e.g. cancer apoptosis

Claim 21; Column 27; 28pp; English.

The present invention describes antisense oligonucleotides which the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to go delay inflammation or tumour formation by promoting apoptosis human cells or tissues. They can also be used as research agents establish the function of particular genes and as diagnostic agen o be used as research agents to genes and as diagnostic agents agents to prevent modulate in

They can also be used as research agents to establish the function of particular genes and as diagnostic agents sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; Al; anti-apoptotic; bcl-2-related protein; antisense inhibition; mcl-1; apoptosis; cancer; antiinflammatory; cytostatic; tumour; inflammation; diagnosis; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic cl-2-related proteins in a sample. The antisapes oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apoptosis and treating associated diseases e.g. cancer -

They can also be used as research agents to establish the function of particular genes and as diagnostic agents sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mol-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins are useful for inducing apoptosis and treating associated diseases e.g. cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

Claim 21; Column 27; 28pp; English.

XX

XX

Che expression of novel anti-apoptotic bcl-2-related proteins. The CC antisense oligonucleotides can be used as therapeutic agents to prevent CC or delay inflammation or tumour formation by promoting apoptosis in CC human cells or tissues. They can also be used as research agents to CC establish the function of particular genes and as diagnostic agents in CC bcl-2-related proteins in a sample. The antisense oligonucleotides CC given in the present invention were designed to target human Al and CC mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The CC present sequence.
